NSCL Exp. 07037 $^{84}Se(p,d)^{83}Se$

For measuring spectroscopic factors for neutrons near closed shell N=50.

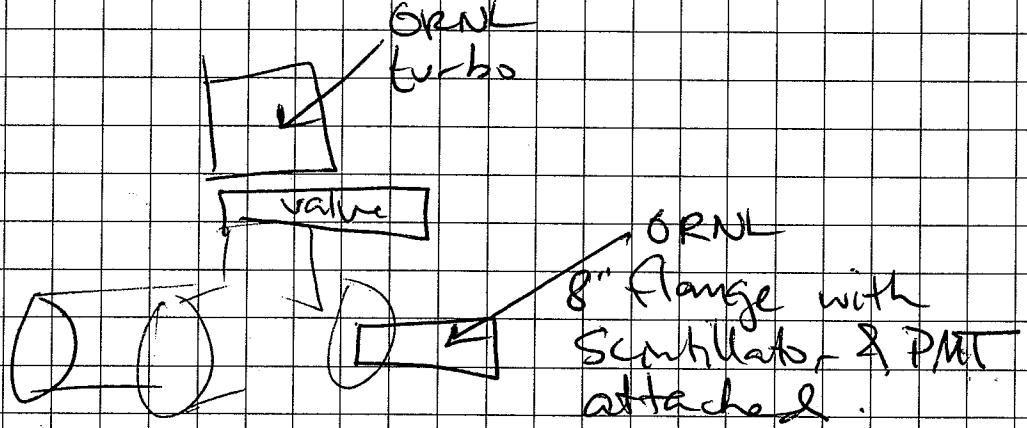
MCP0 & MCP1 drives for TRACKING.

10 plates ordered

Feb 22, 2016

Dan Shapira, Kyle Schmitt, Patrick O'Malley, Rachel Hodges, Tilak Ghosh, Meredith Howard, Jenny Lee, Alisha-Sant

Testing / Mounting plates.
Looking at electronics, etc.

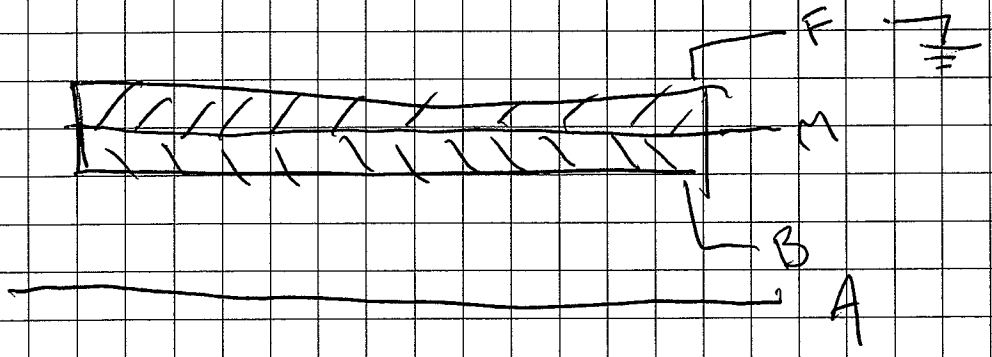


Switching mcp plates

mcp @ RAE 3394 3525

bottom plate
03-027
serial # 1320-02I-45

top plate
03-029
serial # 1320-02I-43



$$\frac{1}{2} \cdot \frac{20 \times 10^{-3}\ V}{50} \cdot 6\ ns =$$

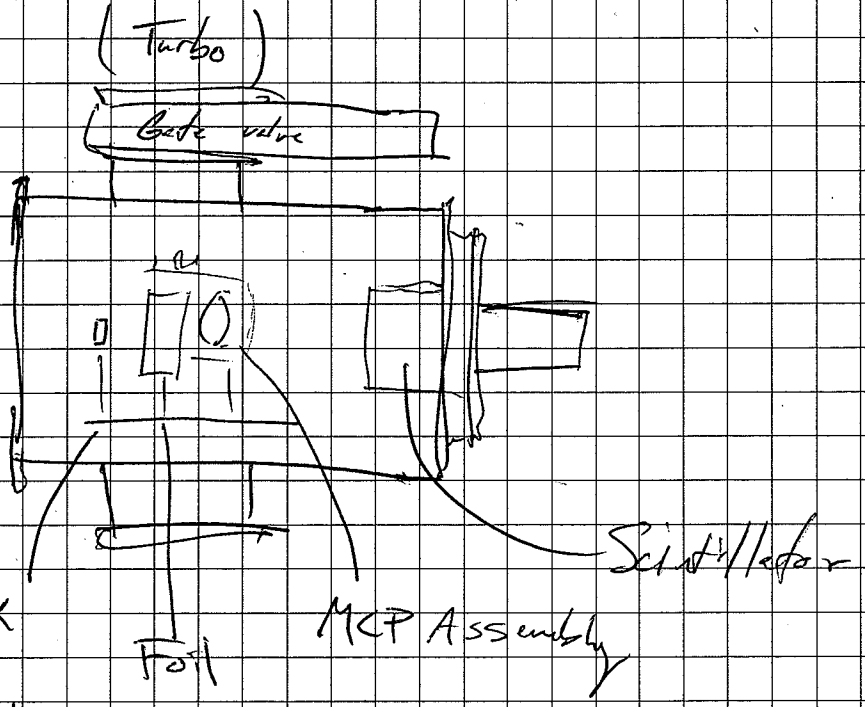
$$\frac{1}{50} \times 10^{-3} \times 6 \times 10^{-9} = 1.2 \times 10^{-12}$$

$$= 1.2\ pC$$

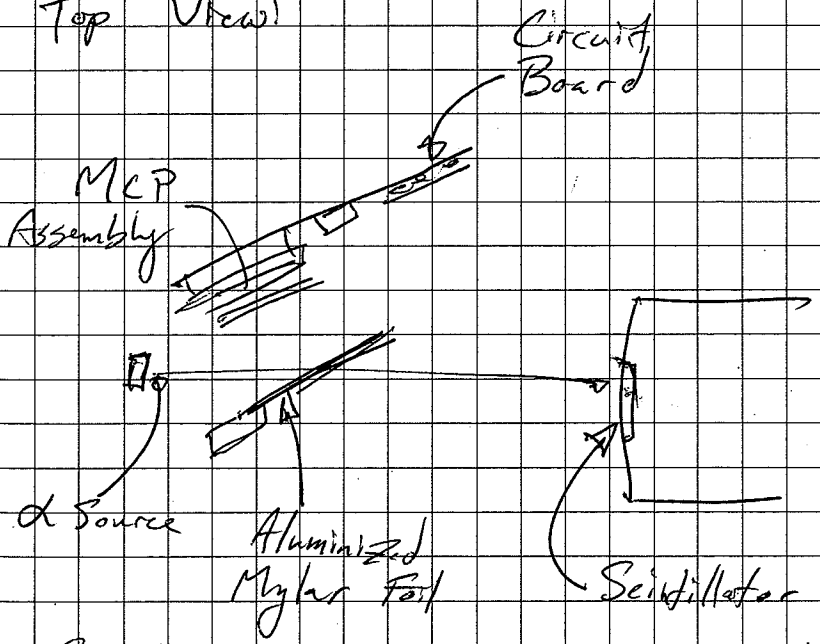
2/22/10

Testing MCP RAE # 3394-3625

Setup: "Round" Cross



Top View:



Signals seen on MCP in coincidence with Scintillator with $V_{Foil} = -400$ V

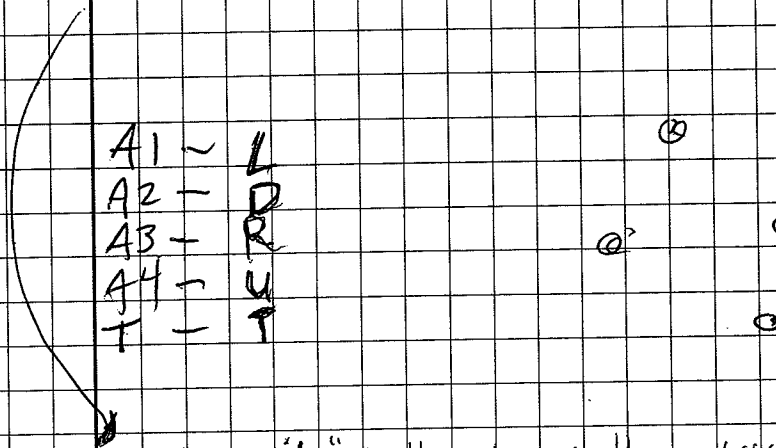
$V_{HV} = +1700$ V

$V_{Sci} = -1200$ V

8/22/10

19:48 signal looks horrible for position output labelled "L" on outside

A1 ~ L
A2 ~ D
A3 ~ R
A4 ~ U
T ~ T



replaced "L" cable + problem was resolved

MCP RAE 3394 - 3237

Put two new plates:

03 - 026 / 1320 - 02I - 44

01 - 021 / 1320 - 02I - 07

MCP RAE 3394 - 3236 - 5H

New Plate:

03 - 028 / 1320 - 02I - 46

03 - 022 / 1320 - 02I - 15

Resistive layer discolored in center. (This was MCP0)

0. Put on latex gloves to keep oils off of MCPs

Steps for replacing MCP Plates:

1. Disconnect cables from board and remove MCP assembly (RAE) from aluminum mount

2. Remove "Front" lug connection and screw

3. Remove cover if present

4. Place RAE on table with active side down and remove 4 screws

b) Keep pressure on front frame. There is a spring inside and unit may want to spring apart

5) Turn over and carefully remove top two pieces, keeping them in the same relative configuration (taping them helps)

6) Carefully remove MCP

7.5) Look at the anode and look for a discoloration slight in the middle. If it is present then the anode needs to be cleaned [see later instructions]

7) gently lift spring [it bends easily] and remove 2nd MCP

8) Place both old MCPs aside and pick up new MCP

9) Locate the notch along the outer rim and place MCP onto frame noting the location of the notch.

10) Gently hold down spring and repeat step 9. making sure the notch is on the opposite side from the 1st MCP

11) Place on the top two pieces, maintaining their alignment to each other and match the notch of the frame with the notch in the plastic.

12) Carefully turn over setup and make subtle adjustments so that the 4 screws may be screwed in

13) Replace Front lug and screw and then replace front cover

$$\frac{300 \times 10^{-3}}{5.0} \cdot 2 \times 10^{-9}$$

$$6 \times 2 \times 10^{-2} = 12\,\text{nC}$$

✓ Good Vacuum Cake!

STEP 1: Paddle Scintillator
+ High Voltage Power Supply (HRA Electronics Rack)
+ Oscillascope

☒ Measure BG signal to test scint.

STEP 2: Paddle Scint: Setup
+ α source
+ Vaccum → ~40 μTorr

☐ Test for α signal under vac. (Only operated scint. in air STP before w/ neutrons.)

↓↑ ~30-100 mV

How much are L's &
how much are cosmic ray backgrounds

Video on camera w/ oscilloscope
data 40.0ns, 20mV scale

2 April 2020

STEP 3: Pump down overnight
to get past outgassing
in Magnetic $\vec{B}$ yoke
assembly.

(No. of sources → looked @ cosmics
→ diff. spectra)

→ More video.

22:50 April 6, 2010

Dan Shapira, Kyle Schmitt, Meredith Howard

Closing Chamber w/ α-source,
MCP Ø setup
Sint. Nator

Pumping Down 11pm
→ 9AM: 6.6E-6 Torr

Big Noise until April 7, 2020
MCP/Target drives totally disabled.
(Not just turning Remote enabling off.)

→ Then smaller noise.
P ~ 6.0 Torr. @ 11 A.M

Crappy MCP signals.
Taking out of chamber
to test in HiRA lab.

7 April 2010

MCP0 target drive

During test, hooked up to I250X-R controller.

Remote Control on 2nd level comp.

Programs → NCS → Qt Param

I250X-R & set controller box @ Chamber to Enable, and to Remote Enable (not Local).

Click [F] icon to get

| I250X-R: GemT6K Probe |

Click [calibrate] (will still say "Uncalibrated")

Takes Several minutes on

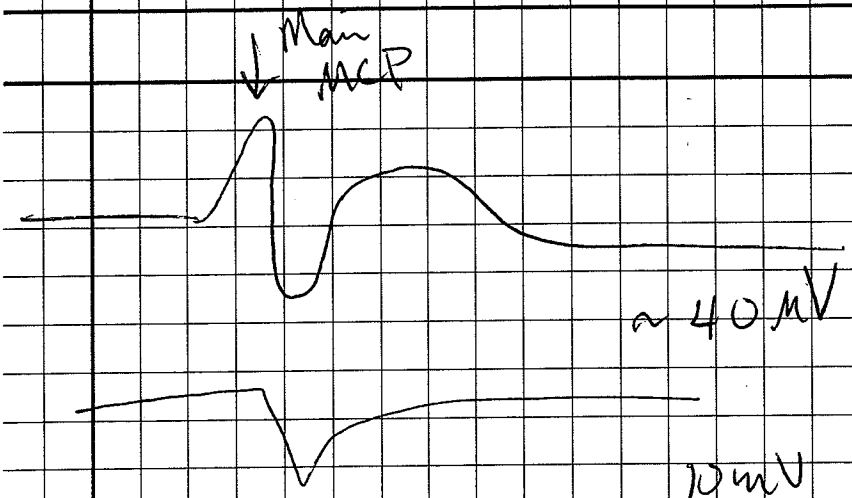
[speed: 2.000].

Setting: 0.000 = Fully Retracted

100.000 = 100 mm inserted upstream.

7 April 2010.

I250X-R "Setting"	Physical Position
190.00 200.00 Best.	Mask w/ Foil
115.00	Foil Only (-75.00)
0	Mostly Clear. ↳ Partially Obstructed ↑ In Magnet's path/gap (Sort of ← should be ok as fully retracted position)



→ keep 40 ns so don't double count

Anode – last electrode

8 Apr 2010

"MCP0"

Had Bad anode cable to chip board.
by Dan Shapira & Kyle Schmitt.

Other had 50Ω resistor replaced/added at the timing out.

Added terminator, too. Signal looks good – doesn't have echo (ringing) like before.

-HV foil → 1000 Volt

12 April 2010

P ~ 4.7 μTorr on Ion Gauge (Chamber)

After taking MCP I out last night (no signal in chamber), looks ok today.

Clean Scint + MCP signals above ~50 MHz noise.

Going to set gate and take Run w/ foil (~1-2 hours) and then Run w/ mask (1/2 day)

Run 5 ~70 Mbytes ~noon - 1:50pm

Foil, no mask,

2 peaks in TIME.01 (MCP) = (2820 - 2470) channels = 350 channels

Changed threshold on discriminator from 1 Volt to -500mV.

Run 6 Foil, no mask, increased threshold on discriminator.

Run 7 Same as Run 6

Run 8

Bill came and helped get rid of the double peaks problem. Changed the timing delay on CFD to 4ns instead of 2ns.

It seems to have solved the problem.

(2 hours data)

↑ Higher

Put in MCP1 mask 8PM

250Y-R = 150.00mm

* Increase Run number

Run 9 Mask in MCP1 (called MCP0 in electronics)

Meredith

Checked to see mask really is in.

Run 10 Mask still IN.

(4 hours)

13 Apr 1

1:20AM

After H.V. Compute outage
(Should not affect data.)

Starting new run. Same as
Run 10.

Run 11

Rough matching: high gain - low gain

corner 0:

LG	HG
353	3030
457	3679

$$\text{slope} = \frac{3679 - 3030}{457 - 353} = 6.24$$

$$\text{offset} = 3679 - 457 * \text{slope} = 827$$

$$HG = \text{slope} * LG + \text{offset}$$

corner 1:

LG	HG
136	144
537	3631

$$\text{slope} = \frac{3631 - 144}{537 - 136} = \frac{3487}{401} = 8.7$$

$$\text{offset} = 3631 - \text{slope} * 537 = -1039$$

corner 2:

LG	HG
72	1747
281	3807

$$\text{slope} = \frac{3807 - 1747}{281 - 72} = 16.9$$

$$\text{offset} = 3807 - 281 \times \text{slope} = -934$$

corner 3:

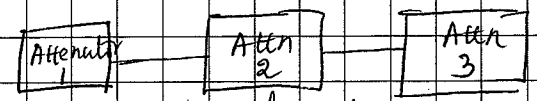
LG	HG
264	826
689	3185

$$\text{slope} = \frac{3185 - 826}{689 - 264} = 5.55$$

$$\text{offset} = 3185 - 689 * \text{slope} = -641$$

Run 13

Pulser calibration for Corner 3.



Ramping from 1 to 0.1 at step of 0.1

Run 14

Pulser Calibration for Corner 2

Run 15

Pulser Calibration for Corner 1

Run 16

Pulser Calibration for Corner 0.

Note: For MCP1 corner 0 (labelled 4 in the detector) has higher gain. may need attenuation during experiment.

MCPO

Run 17

Pulser calibration for Corner 3

Run 18

Pulser calibration for corner 2

Run 19

Pulser Calibration for corner 1

Run 20 Pulser calibration corner 0

15 th April

Cooling flange mounted and chiller on.
All 5 telescope tower mounted, no motherboards.

Pumping Chamber:

Start 5:30 pm
5:35 pm → pressure 41 torr
6:15 pm → pressure 0.174 torr
9:35 pm → 1.6×10^{-5} torr.

16th April 7:00 am → 1.2×10^{-5} torr
8:00 am → 1.2×10^{-5} torr
9:00 am → 1.0×10^{-5} torr → after putting extra cooling clamp and tightening flange
10:00 am → 9.9×10^{-6} torr.

Chris Maggio came for leak checking.
Nothing seems to be found in the door or flange.

Took out water from cooling line.
pressure drops to 8.8×10^{-6}.

Measurement of distance d from telescope to target position:

	d
TOWER : 1	0·250 inch.
TOWER 2 :	0·200 inch.
TOWER 3 :	0·225 inch
TOWER 4 :	0·150 inch
TOWER 5 :	0·200 inch

10/19/10 Monday

Alignment Measurements:

Jack & Tilak secured the low table on the chamber floor and moved the upper platform so that the circular G-10 position blocks were in the middle of the screws that move them.

After ~2 hr,

Target mask

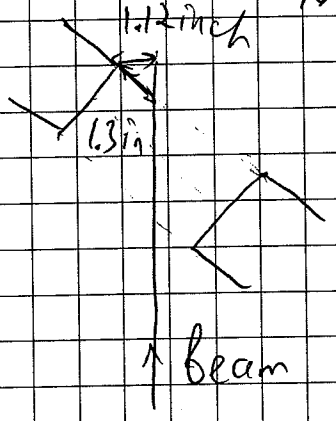
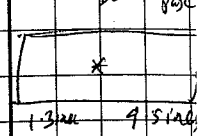
Magnet alignment



The edge of the closest magnet is 1.12 in from the beam line (2.84 cm).



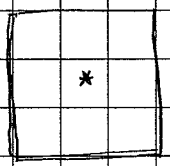
MCP0 edge (all the way back) is 1.5 inches (~4 cm) from the beamline. Pull the stand for mask (We need that to be 5 cm).
$\Rightarrow$ 2 cm so it adds $2\,\text{cm} \times \cos 60 = 1\,\text{cm}$ to the distance from the beam.

* MCP0 magnet were moved to 40 cm distance from MCP1

* MCP1 mask center (the corner of the pattern) is at position 20.55 mm on target drive.

10/19/10

Magnetic Shield hole configuration



centre at
$\frac{1}{8}$ inch high
$\frac{1}{16}$ inch beam right

10/19/10

Pump start : 7:50 pm

8:30 pm 0.80 Torr

8:50 pm turbo gate valve open up. pressure 9×10^{-5} torr

APRIL 28th, 2010

Testing two towers

TOWER 0 (MB #0, MB #1)

TOWER 1 (MB #2, MB #3)

ALL Inspect channels look ok ?

Testing w/ pulser + Readout MB 0-2 no problem individually
Note - V. high thresholds
MB 3 noisy OR and some chips poor resolution. Going one cb at a time.

cb 1	good
cb 2	poor resolution, but not noisy
cb 3	good
cb 4	noisy - refires + poor resolution
cb 5	good
cb 6	good
cb 7	good
cb 8	good

All Except cb 4 together - no refiring, but pos. chips noisy even when cb 2 turned off.
Went away when turned off neg cb. th
changing out cb 4. 36 → 66
same problem
Changed cb 4 from slot 6 to slot 9
same problem
Changed pause delay. MB 3 now runs w/o error

No MB now runs correctly. Change from previously is that pulsers are chained. Run them seperately, and all MB run together. Call it a day

4/29/10 Run 3 in evt test area: Pulser run on MB0-3 w/ current settings
high gain chips & in software
run 0-5 V, 11 steps, 10 s each

inserted low gain jumpers on cb4 in MB0 slots 11, 12, 14, 15.
→ Inspect signals show no sensitivity to this
⇒ Output channels, however, do have smaller gain. Also different offsets

Set new energy offsets on these cb, saved as four MBs_ low gain test. setup, and ran a pulser ramp on MB0, 0-10 V, 21 steps; saved as run 4.

Note that this ramp & above have same pulser setup, i.e. pass4b split to MB 0-4, so did not achieve max pulse height

low gain chips looked saturated at the large pulses, even though output was not saturated.

4/30/10 Trying to get all chips on the DE to read out correctly; some chips wonky (cb 2 & 6), possibly timing problems

Started w/ SIS delay = 2000, AcqDelay = 6720, PauseDelay = 1560
JE recommends 3360 720 160

w/ starting values, many cb read out OK, but not all. When only cb 2 disc on, it doesn't read out at all. Also same for cb 2 at JE values

cb 2 reads out reasonably at
SIS = 3360 Acq = 7000 Pause = 160
but nothing reads out if I turn all cb on - or any other cb on
Those settings work for any 1 cb
fails again if Acq increased to 4500

cb 2 works At SIS = 1520 Acq = 4000 Pause = 1040
fails for multiple cb

Cb 6 the hit is not being addressed correctly - should not consider

SIS = 3360 Acq = 8440 Pause = 1840
works for one cb, two, but not more

Acq = 9460 works for 3 cb 27, but not always one.

Move forward w/ these settings (works for 1–64 chans) and try to fix when Jon is here next week.

Look @ cb6. Try moving from slot 9 to slot 10.
Still addressing as cb20.

Try replacing cb6 (was PS162)

RUN #5 Alpha run on 4 Telescopes

HIGH GAIN

T1 SA 2 Chip 1 BACK

Ch#4 10774 - ~8 MeV (5)

12043 ~ 6 MeV (4)

12874 ~ ~5 MeV (1)

T1 SA 3 Chip 1 FRONT

Ch#3 6620 ~ 8 MeV

5227 ~ 6 MeV

4255 ~ 5 MeV

14 ∞ ~ 2 MeV
16 008 ~ x
~ 22.8 MeV

LOW GAIN

Alpha runs

Problems:

MB0 T3 (only few counts on FF & EB)

MB2 T2 (chip 2 doesn't fire on FF & EB)

slot 526

Run 14

Alpha run + pulser set to 1V
(pulsing all channels)

Run 15 Alpha run ~ 33 min

Run 16 Alpha run

Run 17 Alpha run ~ 40 mins

lowered bias on TOT1 from 350V to 290V

*this telescope doesn't show the alpha peaks so it looks it has dE

(telescope TOTO that is supposed to have dE shows nice alpha peaks)

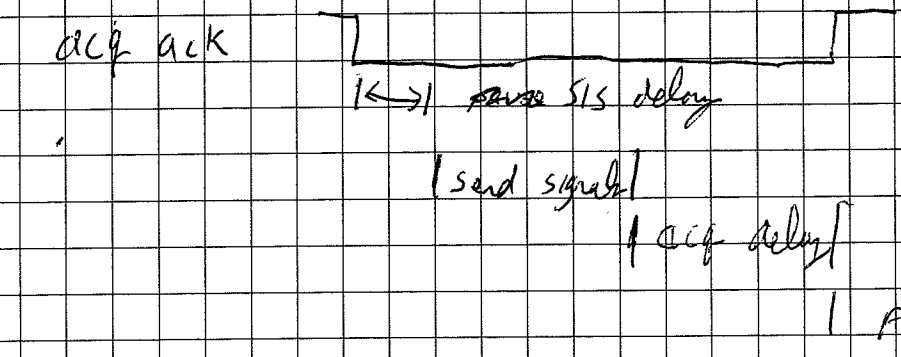
Most likely the mapping is wrong & TOTO ⇔ TOT

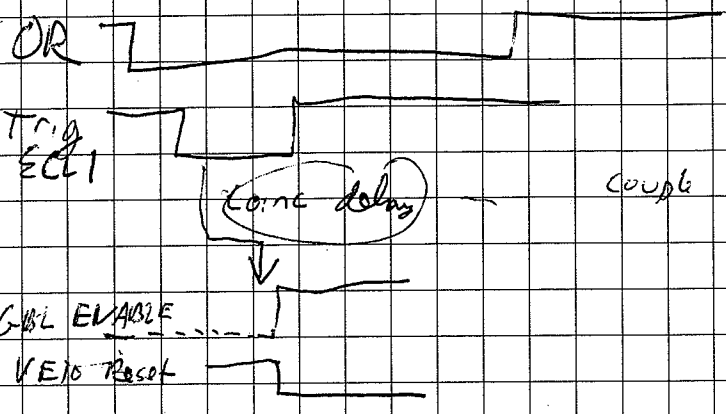
5/3/10 Quick pulser ramp on 2nd dE MB, one chip at a time. Not saved. All chips map correctly. All chips ramp reasonably

This MB regulator is running hot - 45°C w/ 5.98 V supplied. Should check other MB for comparison.

Connected to other dE MB. Temp only reaching ~ 35°C, suggesting cooling problem in other MB. Connected via XLM slot A, & hira_XlmXxv_2mb_1.0.1 able to read out using chip_cont & readout from e09042 on spdaq19. Also runs w/ new readout on spdaq20; Just needs old ASIC_control program. Should still check two-board readout, but looks promising

XLM sends token through to first channel, which passes it on if it doesn't have data. If it has, channel sends acq. acknowledge





~5 μs
2 μs

prevents readout from beginning before values have stabilized

Force_Trig → delay after forced readout set
Acq_all → set all bit registers → print of forced readout

other sliders
~~Reset Ch~~ CSA Ref – set 3
Reset CV – sets auto veto time. need to be 0
256 ok on new chip – external auto veto on ch @ 3.8 μs
can't set internal any shorter or breaks

Analog Ref 512 = 2.500 V -- analog ground for CFD, DACs, shapers

new chip splits this out
ZC2 zero crossing ref

CFD Cap - Capacitor couples signal to CFD
old chips hard coded to 5 pF
new chips set 5 or 12 - basically leave @ 12

Sum offset - used to set multiplicity offset, which can change as you change OR routing

on old chips
Analog Ref may change threshold impacting

5/5/10 RUN 70 Alpha run

TOWER 6 : slot 3 - T10
6 - T9
12 - T17
15 - T1
} MB#5

TOWER 2 : slot 3 - T8
6 - T11
} MB#3

RUN 71 Alpha run (as above)

5/5/10 DE tower 2 still running hot after replacing & tightening cooling connections to regulator. Will try replacing MB

5/5/10 * NOTE *

~~DE PREAMP MAPPING WAS CHANGED from old mapping~~

6 through 14 remain the same.

19 ↔ 4
18 ↔ 3
17 ↔ 2
16 ↔ 1
15 ↔ 0
(swapped)

NEVER MIND
(~~was~~ reverted)

5/7/10 Run 73 - 4 run on t6 in P1

5/7/10.

DE POSITION TO PREAMP MAPPING

POSITION	PREAMP (PA)	POSITION	PREAMP
15	~~X~~ 7	10	10
16	1	11	11
17	2	12	12
18	3	13	13
19	4	14	14
5	5	0	15
6	6	1	16
7	~~X~~ 0	2	17
8	8	3	18
9	9	4	19
	~~10~~		
	16		

DE mother boards won't read out - first test since moved on top of chamber. Found noise in inspect channels. Culprit appeared to be new power supply from JE, but tests w/ old power supply showed that both MB start oscillating when the supplied voltage is above some threshold, ~6.3-6.5 V. Below oscillations immediately disappear. Regulation problem? Threshold appeared to be lower on MB6 than MB5

JE sent a new bit file with "improved logic."
Rev 266

Tried a few values of acq delay & pause delay on our old bit file & on new one for comparison

Acq delay = 7080
Pause 3560.
worked on old bit file, MB 0. All other MB off show 0s.
on new bit file, MB 0 correctly showed 128 chans, but zero event MB gave a ~~4~~ 4103 error.

A = 120
P = 160
Recommended values. Old bit file spits out 0s. Bad.
New file alternates zeros & 4103. Several completes & retriggering

A = 120
~~P 12~~ P = 280 old doesn't work. New doesn't either
like {120,160}

200
4240 OK ~ like first ~ 4103 err

200 like previous
600

Went back through w/ new bit file & only 1 CB on.
No real differences.

JE sent even another bit file, rev 269.

Using the recommended delay, A=120 P=160, we can successfully read out events of multiplicity 1-20, 120
Looks successful!

Jon said the major change was adding edge detection, which was present in earlier versions but got lost in the upgrade.

Mapping for CsI Power/Bias/test

CsI 4 → Tower 0 and Tower 4

CsI 1 – Tower 1

CsI 2 – Tower 2

CsI 3 – Tower 3.

Tower 1	–	T1
Tower 2	–	T2
Tower 3	–	T3

5/8/10 While telescopes were being inserted into towers OR1, looked at noise on MB~~XX~~ 2-4. Just looking at OR and not running readout, set all thresholds to ±10 (whichever indicated a larger threshold), and set CFD Ref so that I was not triggering on noise but that each chip triggered on a 0.3V pulse, split out to MB0-H. Note that this doesn't garentee each channel will fire on that pulse size, or that 0.3V is an appropriate set point. CFD refs ranged ~480 - 520. Held other voltage settings (Analog Ref, DAC offset, ZC2 offset) at default value of 512.

5/8/10

Shaper - CSI mapping

CSI 0 → TOWER 0
CSI 1 → TOWER 1
CSI 2 → TOWER 2
CSI 3 → TOWER 3
CSI 4 → TOWER 4

In each shaper, channels 0-3 correspond to CSI's in the top telescope
4-7 to CSI's in the telescope position second from top,
8-11 " " 3rd from top
12-15 " " 4th from top.

While doing pulser ramps on MB 2-4 (run 76-78) noticed that pulser input cropped out above ~3V, split only to one MB. Also, cross talk between positive and negative channels (or firing off of OR?), but channels don't resolve on themselves given settings from earlier today. Turned off other discrim to eliminate this

When crosstalking, at one point >150 chans were firing and I started getting the 4097 error; timing out. So there is still some multiplicity limit in this current bit TA/delay settings.

Found 2 channels on MB 4 slot 15 that looked bad. Unplugged cable (to telescope but telescope disconnected) and plugged it back in and it got better.

RUN 97

PULSER RAMP FOR MB (5)
CBs 9 - 15 (PULSER (1))

5/11/10

Can get DE motherboards to run on alpha source, but unstably. MB 6 cb 1 basically unusable; others may start firing for no reason but turning discs off and on has a chance of resetting them.

Preamp power supply +12V tripped off twice during testing, reasons unknown.

Several chips or chipboards not seeing alphas, should check cabling.

XLM 1 (slot 14) has started locking up the VME & spdaq regularly.

On MB 5, cb 1 extremely noisy

Unable to bias PO, which is PAIS; MB 6 slot 5

MB 6, cb 4,5,8 v. noisy, not running.

Quiescient current on each DE MB ~ 3.5-4 V. Both will now jump up to >5 V in some conditions. Starting readout makes this jump back down but even moving a slider on the controller makes it go back up, even when all discriminators are off. I suspect this has to do with the global enable. The exact voltage depends on which cb is selected, but is one of only two possibilities -5.40 V or 5.14 V.

5/11/10

CsI Current for tower 4 = 0.2 μA

All channels for P15 looks similar

white Noise without bias ~ 8mV

with bias ~ 3 mV

Pulser input : 4.43 Volt

Preamp output : CsI 3 250 mV
CsI 2 250 mV
CsI 1 250 mV
CsI 0 250 mV

Cosmic output: ~150 mV at all channels

MB 5 slot 14 (10) sometimes PAA reports
15 (13) diagnum = 0

MB 6 slot 14 (2)
15 (3)
NEW slots

MC slot 12 chip 1 - missing channels on preamp (most zeros in (for both pulser & alpha)

→ saw pulser coming out of preamp, plugged back in to MB, and it worked. Must have been plugged in wrong.

→ Traded signal cables on MB 5, and problem tracked chip, not cable.

Much noise on MB 6, had to turn off all discs for MB 5 test.

Took cb from MB 6 slot 14 & 15 and put in slot 2 & 3: No readout problem → slot related.
Suggests we have to pick different slots on MB 5.

Gain test for shaper

shaper CsI 4

input pulse = 1 volt

output channel #	Voltage	noise
1	0.5 volt	
2	9.5 volt	6 mV
3	9.5 volt	6 mV
4	9.5 volt	6 mV
5	6 volt	
6	5.8 volt	4.4 mV

Increase in gain ~ 1.6

Increase in noise ~ 1.36 @

5/18/10

Trying to get Si times working
appear to have ~1 μs range

Several problems in readout.
Always get overflow in T1. Switched external
time & energy double lemos - problem stays w/ time
→ problem is inside chamber
looking at actual signals, they are there, but
one looks much smaller than the other, and both
look a little weird - grounded?

T2 has similar issue. Switched
E&T - problem tracks to inside chamber. Also
tested that it isn't FADC.
Looking at signals, one side appears completely disconnected.

Bill found a spare inside-chamber cable, but
one of the two cables has its two leads shorted
together, and will need to be fixed.

Switched to HiRA-S800 Coin trigger (around run 152 or 153) and observed that the EOR is low almost all of the time. This is quite strange we ending run almost purely a ~~S~~ S800 trigger. ~~Then~~ adjusted the delay on MCP to be about 80ns later on "Corners" going to QDC. Found that adding 50ns to MCP delayed is not enough. Need to add ~~100ns~~ 100ns total.

EOR is ~~most of the~~ time low (meaning on) while ~~the~~ trigger is in coincidence mode ⇔ ~~we need~~ at this time the busy circuit is off.

Stopping the run to try to run with ΔE pulser.

Find errors in the run Control page ⇔ waiting for "complete latch".

Firing like crazy

* At 5:57 am we noticed Tow 5 TC0 was rising in temperature. It reached as high as 47.06, up from 42.06 at 1:00 am. Bill went down to the vault to address the issue once it was clear the temperature was not coming back down. Within minutes the temperature came down to ~43. Then Bill shut off the voltage to the motherboards, when power was restored the temperature held constant at 42.06.

* Within 5 minutes the temperature of Tow 5 TC 0 was back over 47. Bill was able to bring the temperature down to 42.06 and the temperature remained at safe values.

* At 7:07 am we noticed Tow 5 TC0 was rising again (over 45) but without any changes the temperature returned to < 43.

~~desparation setup~~

* new ~~files~~: gain and threshold setting: file "lowgainsmall delay.setup" loaded.
live time increases to 80%. (earlier value ~30%).

10:00 am MCP1 bias is down now. Foil is still in it's place.

5/22/10 @ 10:20 am DDSC. Run 163
Found XFP & RF scalers were missing b/c of bad NIM bin in data U. Fixed. See scalers.

Switched to HiRA singles to focus on HiRA readout. Only reading out ASICs & CsI. Looking at timing, CsI signal falls within gate.

Lengthened master to 1 μs to catch all gate & coincidence.

HiRA triggering reasonably as trigger, but many ΔE in every event. Should raise thresholds here. Start with CsI ADC thresh - Betty will check we aren't cutting off punchthroughs.

When HiRA + S800, HiRA goes nuts. Decided to use EB OR instead of EF OR, because it is more stable.

Turned on MCP. Checked timing. MCP gate timing always set by MCP delayed OR, and is always in coincidence w/ trigger. Gate comes about 20 ns before signal, which is iffy, but I think there is additional delay downstairs ~~delay~~ before the gate is patched out, so probably OK.

2:15 pm switch to 10 μm target & S800 turn

* problem with ion source. Key is handed over to operators.

4:00pm Noticed that MCP TDC didn't read out. Discovered that gate was miswired. Should read out from now on, starting run 175.

RUN 181

Before this run we found out that the TDC downstairs is a multihit one. And we weren't seeing MCP1 time and MCP1 downscaled times in the TDC. So we added ~90 ns to the stop and ~150 ns to HiRA OR so they don't come too early.

Dan C notes later: the TDC is a V775, which is multievent, not multihit. Since we read this out after every trigger, this doesn't mean anything to us. We read a maximum of one hit per channel per event.

Run # 186	Beam: 86 Kr	Date: 23 May 2010
Avg. Rates	Beam Energy: 45.6	B ρ: 2.30271 (Seg. 8)
MCP0:	Trigger: S800 & HiRA	Target: 10 um CH2
MCP1:	Drives [mm]	Attenuation: 10 K
XFP:	I250X-R: 0 MCP0	OnShift: Micah Alisher Jack Betty Brett
Live Time:	I250Y-R: 0 MCP1	
Live Trigger:	I251Y-R: 150 Target	
Comments: Below		

Continuing to collect coincidence data.

Run # 187	Beam: 86 Kr	Date: 23 May 2010
Avg. Rates	Beam Energy: 45.6	B ρ: 2.30271 (Seg. 8)
MCP0:	Trigger: S800 & HiRA	Target: 10 um CH2
MCP1:	Drives [mm]	Attenuation: 10 K
XFP:	I250X-R: 0 MCP0	OnShift: ~~Micah~~ Micha Alisher Brett
Live Time:	I250Y-R: 0 MCP1	
Live Trigger:	I251Y-R: 150 Target	
Comments: The DAQ crashed before starting this run		

We decided to turn off the MCP1 so that we can turn up the beam intensity to get some good statistics. We ended Run 187 early to make this change.

Run # 188	Beam: 86 Kr	Date: 23 May 2010
Avg. Rates	Beam Energy: 45.6	B ρ: 2.30271 (Seg. 8)
MCP0: out	Trigger: S800 & HiRA	Target: 10 um CH2
MCP1: off	Drives [mm]	Attenuation: 1000
XFP: 600 n	I250X-R: 0 MCP0	OnShift: Meredith Micha Alisher Brett
Live Time:	I250Y-R: 0 MCP1	
Live Trigger:	I251Y-R: 150 Target	
Comments: Turned the attenuator down to 1000.		

Turned off the MCP1

~97% Live. Clock

Run # 189	Beam: 86 Kr 45.5 MeV	Date: 23 May 2010 9:15AM
Avg. Rates	Beam Energy:	B ρ: 2.3027 (Seg. 8)
MCP0: out	Trigger: S800 + HiRA coin	Target: 10 μm CH2
MCP1: off	Drives [mm]	Attenuation: 1k
XFP: .6 M	I250X-R: 0 MCP0	OnShift: Meredith
Live Time:	I250Y-R: 0 MCP1	
Live Trigger: ~~6962~~	I251Y-R: 150 Target	
Comments:		

Slits opened to increase rate XFP from ~0.63 M to 0.83 M. No other change here.

Run # 190	Beam: 86 Kr	Date: 23 May 2010
Avg. Rates	Beam Energy: 45.5 MeV/u	B ρ: (Seg. 8)
MCP0: out	Trigger: coin	Target: 10 μm CH2
MCP1: off	Drives [mm]	Attenuation: 1k
XFP: .8 M	I250X-R: 0 MCP0	OnShift: Meredith
Live Time:	I250Y-R: 0 MCP1	
Live Trigger:	I251Y-R: 150 Target	
Comments: Opened coupling, live slits		

10:15 AM

Run # 191	Beam: 86Kr	Date: 23 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: 2.34690 (Seg. 8) = 2.30271
MCP0: out/off	Trigger: S800+HiRA	Target: 10 μm CH2
MCP1: in/off	Drives [mm]	Attenuation: 1k
XFP: 700k	I250X-R: 0 MCP0	OnShift: Meredith
Live Time: 90%	I250Y-R: 165 MCP1C	
Live Trigger: 2.6k?	I251Y-R: 150 Target	
Comments: No change from 190. Hi XAP Rate		

11:05 AM

Run # 192	Beam: 86 Kr	Date: 23 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: 2.30271 (Seg. 8) 2.[redacted]1
MCP0: out / off	Trigger: S800 + HIRA	Target: 10 μm CH2
MCP1: in / off	Drives [mm]	Attenuation: 1 K
XFP: 700 K	I250X-R: 0 MCP0	OnShift: EM MH TG
Live Time:	I250Y-R: 165 MCP1 ∈	
Live Trigger:	I251Y-R: 150 Target	
Comments:		

NOON 23 May 2010

Talked to cyclotron operator. He was increasing beam to maintain CRAD 06 (XFP) rate in ~~7=85~~ 0.70 – 0.85 MHz range. Doing so caused CRAD 04 (S800 FP rate) to hit

Run # 193	Beam: 86Kr	Date: 23 May 2010
Avg. Rates	Beam Energy: 45.5	B ρ: same (Seg. 8)
MCP0: —	Trigger: S800 HiRA	Target: 10 μm CH2
MCP1: in / off	Drives [mm]	Attenuation: 1k
XFP: ~610 k	I250X-R: 0 MCP0	OnShift: MH, EM, TG
Live Time:	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 150 Target	
Comments: ~~XFP eff~~ XFP/S800FP ratio is drifting.		

Enrique Merino - ~~fo~~ found negative scalers for XFP & one other. Shortening Run time ~50 min.

Run # 194	Beam: 86Kr	Date: 23 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: _____ (Seg. 8)

Saw that the MCP1 QDC low gain have large negative pedestals ⇒ go into Vault and get ready for.

Run 197 MCP1 mask in.
Timing gates looked funny. B.L. changed.

Run 198 ATT=10
Same as 197 except gates adjusted by B.L.

Run 199 ATT=100
Same as 198

23 May 2010.

(X) Run 199 Ended to go into vault.

The MCP gate was updating on the trailing pulses. So we put in a short MCP gate into the coin after 30ns delay to veto subsequent updating

Run 200

Mask MCP1. Still no capacitors added to MCP1 corners low gain. Timing gate adjusted by B. Again.

Run 201

Added capacitors to MCP1 corners to address Hi/Lo gain issues. Will compare to other calibration.

Going to production mode

1. Slits I255 in "blocker" position
   top slit closed to 4.40 position.
2. MCP1 carbon foil in (165 mm).
3. 25 μm CH_2 target in place.
4. ATT = 1 with slits in CCF coupling line not fully open.

~~MCP~~

Switched to coincidence mode. MCP downscaled master looks a little funny. The coincidence data looks to be correctly timed. The experiment through

Comments: Rates have dropped significantly		

Tuesday (early morning)

At around Midnight we turned over the beam to the operators to be returned because the beam intensity had dropped by almost a factor of 2. They gave it back after an hour or so, and the rate was back up, almost. Operators said that this is all they could give us. after restarting the run, the daq crashed, and was restarted.

—Jack W.

ending 4:15 am:

Run # 235-240	Beam: 84Se	Date: 25 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: _____ (Seg. 8)
MCP0: X	Trigger: S800+HiRA	Target: 25 μm CH2
MCP1: 130 k	Drives [mm]	Attenuation: 1

Comments: Ended 244 to enter vault + for a quick beam tune		

CRDC MASK

245 MASK 1 upstream
viewer only in.
~5 minutes Beam dropped.

246 MASK 1
No viewer, empty

247 MASK 2
No viewer, then viewer,
w/ and w/o 17mg C target

248 MCR1 MASK
w/ 17mg C target
CRDC2 mask was in.

249) MCP 1 Mask, nothing else in beam line.

250) Removed HiRA from Readout, both ASICs & CsI, to speed up data acq.
MCP1 Mask w/ 100 μm CH2 target in beam

251) Target mask run
w/ MCP1 carbon foil in

252) Target mask, as 251

After these, handed the Key over to Jorge to shim the A1900 XFP. Took this time to change back to coincidence trigger, add ASIC and CsI back to readout, and flush the chiller twice. This involved shutting off the ASICs; when I reloaded them, I turned on the dEs one Chipboard at a time.
Put in 25 μm CH_2 target, and put 5800 slits back in.

253) Production run w/ 84Se (p,d)

Run # 253	Beam:	Date: 25 May 2010
Avg. Rates	Beam Energy:	B ρ: (Seg. 8)
MCP0:	Trigger: Coin S800+HiRA	Target: 25 μm CH2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: MCP0	OnShift:
Live Time:	I250Y-R: MCP1	
Live Trigger:	I251Y-R: Target	
Comments: XFP shimmed by Jorge & D4 (I228DS) Matched		

Run # 254	Beam: 84Se	Date: 25 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: 2.3750 (Seg. 8)
MCP0:	Trigger: S800 + HiRA coin	Target: 25 μm CH2
MCP1: 205 kHz	Drives [mm]	Attenuation: 1
XFP: 306 kHz	I250X-R: 0 MCP0	OnShift:
Live Time: 99%	I250Y-R: 165 MCP1	
Live Trigger: 1-5 Hz	I251Y-R: 100 Target	
Comments: Adjusted I255 slits @4.40 to 4.41. Peak is missing.		

Where did ^{84}Se trail go?? It is more covered by S800 FP slits than before.

12:00 PM

Comments: I255 slits opened to 4.43 then 4.44		

12:32pm

Run # 256	Beam: 84Se	Date: 25 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: 2.375 (Seg. 8)
MCP0: X	Trigger: S800+HiRA coin	Target: 25μm CH2
MCP1: 200 kHz	Drives [mm]	Attenuation: 1
XFP: 300 kHz	I250X-R: 0 MCP0	OnShift: Rachel
Live Time: 99%	I250Y-R: 165 MCP1	
Live Trigger: ~3	I251Y-R: 100 Target	
Comments:		

1:25 PM

Run # 257	Beam: (none)	Date: 25 May 2010
Avg. Rates	Beam Energy: N/A	B ρ: N/A (Seg. 8)
MCP0: X	Trigger: S800 & HiRA	Target: 25 μm CH2
MCP1:	Drives [mm]	Attenuation: N/A
XFP:	I250X-R: 0 MCP0	OnShift: Meredith, Brett, Andy, Betty, Tony, Dan C, Dan B.
Live Time:	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments: No beam!		

Running Background with no beam.

1:32 PM

Run # 258	Beam: 84Se	Date: 25 May 2010
Avg. Rates	Beam Energy: 45.5MeV	B ρ: 2.375 (Seg. 8)
MCP0:	Trigger: S800 & HiRA	Target: 25 um CH2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: 0 MCP0	OnShift: Meredith, Dan B, Bill, Dan C, Betty, Tony, Brett, Andy
Live Time: ~99%	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments: Adjustment of beam. (dE's were still off)		

Adjusted Z001 spot position.

DE's were off so we killed the run and turned them on for Run 258.

2:56 PM

Run # 259	Beam: 84 Se	Date: 25 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: 2.375 (Seg. 8)
MCP0: X	Trigger: S800 & HiRA	Target: 25 μm CH2
MCP1: ~170 KHz	Drives [mm]	Attenuation: 1
XFP: ~250 KHz	I250X-R: 0 MCP0	OnShift: Brett, Tony, Andy, Meredith, Dan B, Dan C
Live Time: ~99%	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 160 Target	
Comments:		

Turned on dE's and started run.
3:54 AM

Run # 260	Beam: 84 Se	Date: 25 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0: X	Trigger: S800 & HiRA	Target: 25 μm CH2
MCP1: ~180 KHz	Drives [mm]	Attenuation: 4
XFP: ~260 KHz	I250X-R: 0 MCP0	OnShift: Meredith, Brett, Dan-B, Remi, Tony, Andy
Live Time: ~99%	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments:		

Stopped beam for primary tune before shift change. Continuation of Run 259. Daniel Bazin matched I2280S, but didn't take right away. Stopped run to match again for run 261. 4 PM 25 May 2010.

Run # 261	Beam: 84Se	Date: 25 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: (Seg. 8)
MCP0:	Trigger:	Target: 25 μm CH2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: 0 MCP0	OnShift:
Live Time:	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments:		

Operator will take beam in next ~4 hours to change stripper foil.

Add [END] of Run 261,

" Warning: eventlog may not have finished normally continuing w/ post run actions "

XFP: 246831	I250X-R: 0 MCP0	OnShift:
Live Time: 99.4	I250Y-R: 165 MCP1	Special run: TO8717 have new lower thresholds from Dan Coupland.
Live Trigger:	I251Y-R: 100 Target	

Comments:

Run # 293	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0:	Trigger: S800+ HiRA	Target: 25 um CH2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: 0 MCP0	OnShift: ~~[illegible]~~ Mike
Live Time:	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	

Comments:

293 is another data run with modified thresholds on 2 dE's.

12:20 PM

* Failed run due to DAQ

Run # 294	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45MeV	B ρ: 2.375 (Seg. 8)
MCP0:	Trigger: S800&HiRA	Target: 25 um CH2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: 0 MCP0	OnShift: Mike, Brett, Remi, Dan B., Zibi, Andy, Tony, Enrique
Live Time:	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	

Comments:

The DAQ crashed at the end of the run so we rebooted the program

12:04 PM

Run # 295	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0: ~~—~~	Trigger: S800 & HiRA	Target: 25 um CH2
MCP1: ~120 KHz	Drives [mm]	Attenuation: 1
XFP: ~185 KHz	I250X-R: 0 MCP0	OnShift: Mike, Zibi, Brett, Andy, Dan B., Tony, Enrique, Remi
Live Time: ~99%	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	

Comments:

1:46 PM

Run # 296	Beam: 84Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0: ~	Trigger: S800 & HiRA	Target: 25 um CH2
MCP1: ~165 KHz	Drives [mm]	Attenuation: 1
XFP: ~240 KHz	I250X-R: 0 MCP0	OnShift: Brett, Andy, Dan B., Enrique, Remi, Mike, Tony
Live Time: ~99%	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments:		

We were going to the operator's control room to ask for a beam tune, but the operators gave us a quick tune before we asked. They said we should be fine until about 4:00pm.

2:30 PM

Run # 298	Beam: 84Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0: ~	Trigger: S800 & HiRA	Target: 25 um CH2
MCP1: ~160 KHz	Drives [mm]	Attenuation: 1
XFP: ~250 KHz	I250X-R: 0 MCP0	OnShift: Mike, Brett, Enrique
Live Time: ~99%	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments:		

(Run 297 was a junk run because the DAQ crashed!)
The beam is fine, CRDC6 ~ 2.5

Run # 299	Beam: 84Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: 2.375 (Seg. 8)
MCP0:	Trigger: S800 + HiRA coin.	Target: 25 um CH2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: MCP0	OnShift:
Live Time:	I250Y-R: MCP1	
Live Trigger:	I251Y-R: Target	
Comments:	Stopped so Jose could examine XFP signal	

Jorge P-C looked at XFP ~~single~~ signal. From 7AM to 3PM - clear degradation of signal. Eff. as measured by company XFP & p.in detector signal was near 1.0 ratio.

Will call J.P. @ dinner 4/Updesk.

Run # 300	Beam: 84Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45.5MeV	B ρ: _____ (Seg. 8)
MCP0: out	Trigger: S800+H.R.Acqu	Target: _____
MCP1: _____	Drives [mm]	Attenuation: 1
XFP: _____	I250X-R: _____ MCP0	OnShift:
Live Time: _____	I250Y-R: _____ MCP1	
Live Trigger: _____	I251Y-R: _____ Target	

Comments:

Gave the key to the operator for primary beam tuning. Before the primary tuning, the rate on the XFP was 158 KHz

4:00pm PRIMARY BEAM RETUNED

~4:30pm AFTER THE TUNING ~ 600 enA

05/26/2010 XFP ~ 350 KHz

Run # 301	Beam: 84Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45.5	B ρ: _____ (Seg. 8)
MCP0: out	Trigger: S800	Target: _____
MCP1: 190 ℓ	Drives [mm]	Attenuation: _____
XFP: 350 ℓ	I250X-R: _____ MCP0	OnShift: MILAN
Live Time: 99%	I250Y-R: _____ MCP1	
Live Trigger: _____	I251Y-R: _____ Target	

Comments:

6:50 pm

beam back after the CCF water leak

intensity 630 enA

Run # 303	Beam: 84Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: 2.375 (Seg. 8)
MCP0: out	Trigger: 5800 + HiRA	Target: 25 μm CH_2
MCP1: 196 K	Drives [mm]	Attenuation:
XFP: 335 K	I250X-R: 0 MCP0	OnShift: ajilar
Live Time: 99%	I250Y-R: 165 MCP1	Milan
Live Trigger:	I251Y-R: 100 Target	
Comments:		

Run # 304	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45.5 MeV	B ρ: 2.375 (Seg. 8)
MCP0: out	Trigger: 5800 + HiRA	Target: 25 μm CH_2
MCP1: 189 K	Drives [mm]	Attenuation:
XFP: 315 K	I250X-R: 0 MCP0	OnShift: ajilar

Live Trigger:	I251Y-R: 100 Target	Jacl
Comments: Normal data Run		

Run # 305	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2,375 (Seg. 8)
MCP0: out	Trigger: 5800 & HiRA	Target: 25 μm CH2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: 0 MCP0	OnShift: [redacted] ?
Live Time:	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments: (Filled out several hours before my shift)		

(so I won't have all the info on runs 305 - 306)

Run # 306	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0: —	Trigger: S800 & HiRA	Target: 25 um CH 2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: 0 MCP0	OnShift: ?
Live Time:	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments: (Not here during run)		

Run # 307	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0: —	Trigger: S800 & HiRA	Target: 25 um CH 2
MCP1:	Drives [mm]	Attenuation: 1
XFP:	I250X-R: 0 MCP0	OnShift: Milan
Live Time:	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments: Arrived At end of run		

10:55 PM

Run # 308	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0: —	Trigger: S800 & HiRA	Target: 25 um CH2
MCP1: ~160 KHz	Drives [mm]	Attenuation: 1
XFP: ~270 KHz	I250X-R: 0 MCP0	OnShift: Brett Meredith Jack Bill Milan
Live Time: ~99%	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments: Data Run		

10:48 PM

Run # 309	Beam: 84 Se	Date: 26 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0: —	Trigger: S800 & HiRA	Target: 25 um CH2
MCP1: ~170 KHz	Drives [mm]	Attenuation: 1
XFP: ~310 KHz	I250X-R: 0 MCP0	OnShift: Jack Meredith Brett Milan Betty
Live Time: ~99%	I250Y-R: 165 MCP1	
Live Trigger:	I251Y-R: 100 Target	
Comments: Beam still looks strong.		

Run # 310	Beam:	Date: May 2010
Avg. Rates	Beam Energy:	B ρ: (Seg. 8)
MCP0:	Trigger:	Target:
MCP1:	Drives [mm]	Attenuation:
XFP:	I250X-R: MCP0	OnShift:
Live Time:	I250Y-R: MCP1	
Live Trigger:	I251Y-R: Target	
Comments:		

Jorge shimmed the XFP. He said the efficiency was near 97% ← before shimming. What does it all mean?

(We measured the efficiency to be ~65%)

Run # 311	Beam:	Date: May 2010
Avg. Rates	Beam Energy:	B ρ: (Seg. 8)
MCP0:	Trigger:	Target:
MCP1: 144K	Drives [mm]	Attenuation:
XFP: 270 K	I250X-R: MCP0	OnShift:
Live Time:	I250Y-R: MCP1	
Live Trigger:	I251Y-R: Target	
Comments:		

3:20 AM

Run # 312, 313	Beam: 84 Se	Date: 27 May 2010
Avg. Rates	Beam Energy: 45 MeV	B ρ: 2.375 (Seg. 8)
MCP0:	Trigger: S800 & TRIKA	Target: 25um CH2
MCP1: ~160 KHz	Drives [mm]	Attenuation: 1
XFP: ~300 KHz	I250X-R: 0 MCP0	OnShift: Jack
Live Time: ~99%	I250Y-R: 165 MCP1	Micha
Live Trigger:	I251Y-R: 100 Target	Brett
Comments: Data run. Beam looks strong.		

* At the conclusion of Run 313 the DAQ froze and the 50 minute run was "over written". Run 314 was a short run before the DAQ crashed. Subsequently, we rebooted spdaq 20 to avoid any further data loss.

* → For runs 315-323, using wrong ASIC file (trigger off of EF)

Comments:		

Raised discriminators in CsI to 255. This changed the ~~total~~ counts rate w/ no beam for 1355 ~~counts~~ w/ beam 18:29 ⇒ 1109s

		RATE		RATE	
CSI0_OR	5	.037	555	.50	7%
CSI1_OR	5	.037	1426	1.29	2.9%
CSI2_OR	10	.074	6073	5.47	1.3%
CSI3_OR	6	.044	2985	2.69	1.6%
CSI4_OR	9	.066	814	.734	9%

overwrote the discriminator file at disc_07032.dat.

326: inserted DE pulser into trigger. Testing welding effect on DE electronics. Pulser in DEs @ 2 Hz. Added to scaler 15 as raw & live. No beam

327: No welding

328: Turned pulser to normal values 0.5V @ 2Hz. It was unset in 326-327, so ignore those runs. This has no welding. S800 out of readout for speed.

329: welding.

330: S800 back in trigger, beam in, pulser off but still in trigger. Data Run

Run #334 Pulser ramp for DEs

0 - 0.2V, 21 steps

e07037_dc_slave_midthresh_[illegible]_setup

Run #335 PEDESTAL RUN FOR DEs

Run #336 Pulser ramp for DEs

0.2V, 4 steps

e07037_dc_slave_lowthresh_setup

Run 337 XFP Not biased.
S800 not in readout seq.

Run 338 XFP on BUT hi CRADOY

Run 339 BAD

Run 340 S800 + nothing else
in readout.
S800 SINGLES

Run 341 Restarting Readout

to put everything back in readout. CRADO4 drops from ~5 kHz to 0.3 kHz with Daniel Bazin's change of left slit from 4.40 to 4.20.

Run 342) short run, continuing previous

Run 343) continue previous DAQ ended at end of run. Status bar is red - spectrodaq is out of page. Restarted spdaq20. Note that as usual, this happened after Daniel Bazin was looking at his specialized S800 spectra. Bill took this opportunity to go into vault and look @ XLM trigger.

Run # 341	Beam: 84Se	Date: 5/27 May 2010

~~Live Trigger~~: 3.5/s	I251Y-R: 100 Target	
Comments:		

main parameters

~~The problem discussed of~~
We observed in Run 341 that the OR was about 30 ns long. This was the length for OR5 without triggers
So we decrease Deadtime by increasing reset CW for each chipboard Now the OR ~~for~~ without triggers is 6 ns long; This means that the Chipboard level reset is not work
Why? Who knows?

SEVERAL SHORT RUNS:

342 - short run, but good data, same as 341

343 - good data after spdaq crashed

344 - test data, just S800 singles to check CEAD 04

345

346 - most of the motherboards were not included into the trigger

347 - same (?) as 346

W. Lynch

During the attempt to do the intensity calibration I noticed that the coincidence rate did not scale with beam intensity. Looking at the coincidence circuit I found that ~~most~~ most of the coincidence were not real coincidences but simply the HiRA OR did not reset but waited until the next 5800 ER trigger. We tried many things but eventually we just raised some of the thresholds on the Tel Scope in P11. By the way, the chipboard level reset circuit is dead on all boards the reset is defined by the reset CV.
